

Apps are here for us to access data and interact with our technology in a straightforward, easily accessible manner. Introducing Bridged, the ultimate achievement of this. The purpose of this app is to BRIDGE all of a user's favorite apps together for a more unified, intentional use. BRIDGED would simultaneously collect each song a user listens to over a period of time, each social media post that the user likes, comments on, or posts, what users search on the internet, who the user texts and the content of the messages, and any other potential media usage on their device. This app will collect moments that it finds as emotionally significant for the user and compile them into groups based on how similarly they can be grouped into a mood through an algorithm.

BRIDGED

Additionally, reminders will pop up once BRIDGED notes a change in mood for the user. The app will send out frequent, but unpredictable notifications prompting the user to do a variety of things and reminding them how the media they are viewing may make them feel based on previous instances.

Why is this app important?

After the initial collection period, BRIDGED connects the user directly to their device. This makes it easier for individuals to understand their moods; this is an app that can tell patterns and trends in moods, while drawing attention to what forms of media are affecting their moods more than others. Users can always add additional information such as notes or direct mood inputs to assist the algorithm in accurately creating the correct schema. In this way, all of a user's thoughts and feelings can become a part of the media, and they can store history of moods and emotions in the same way that so much other media is stored.
